

# Capacity Growth- Evidence, Warnings and Alternatives

#### **Panelists:**

Michael H. Boston, Principal Trade Support Group Operations Manager Securities Bank of America

Jacob Granek, Managing Director
Depository Trust & Clearing Corporation

**Thomas J. Jordan**, *President & CEO* Jordan & Jordan

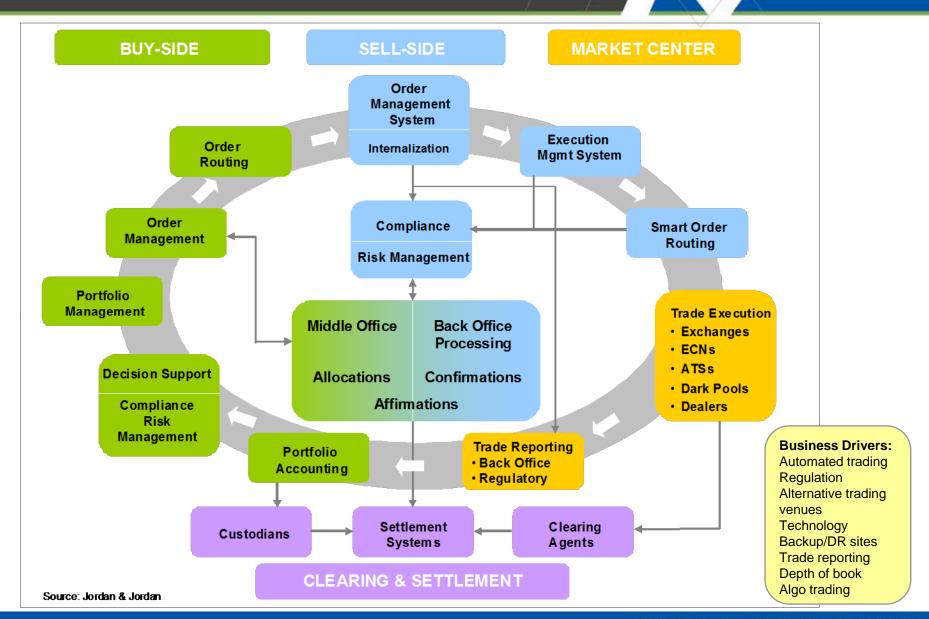

### Panel Agenda

- »Understand current capacity needs in front and back office
- »Use data and disciplined approach to measuring risk of capacity shortfall
- »Discuss potential alternatives for handling capacity

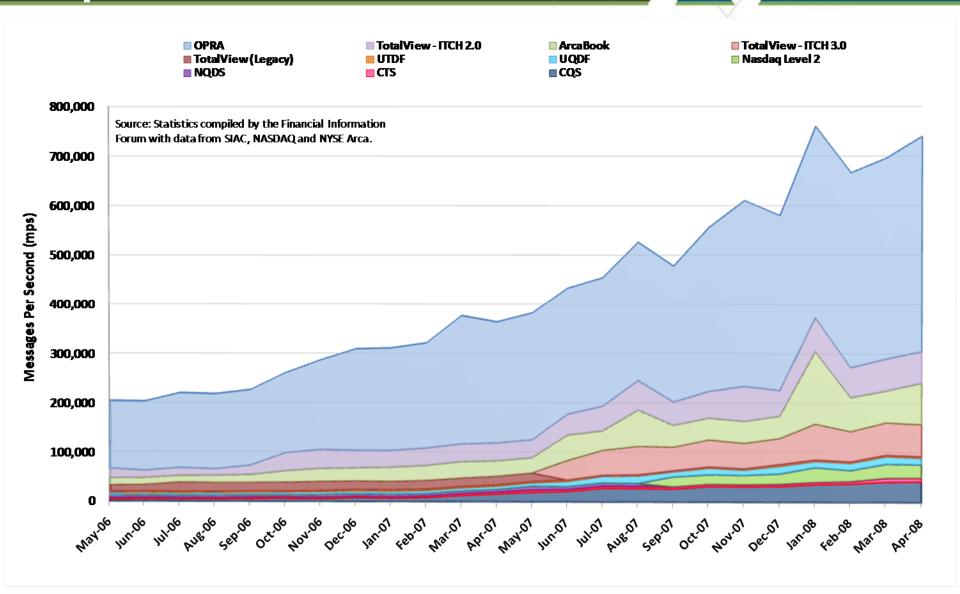

#### **US Securities Trade Flow**

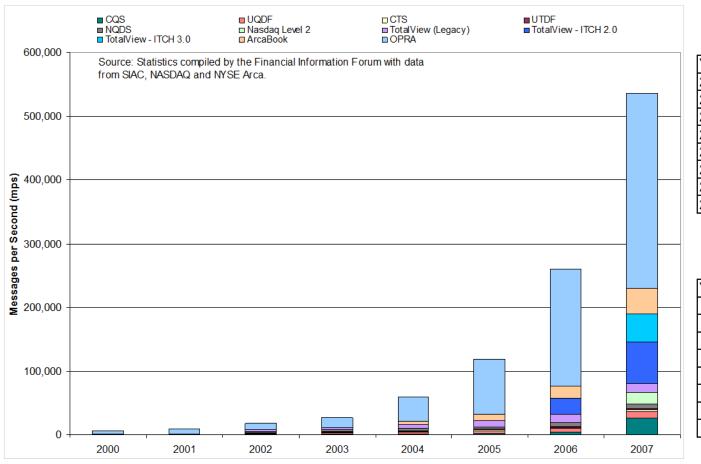

# **Consolidated Options & Equities 5 Second Peak Rates**

## **Consolidated Options & Equities 1 Minute Peak Rates More Than Doubled in 2007; Equities Alone Tripled**

#### **Combined Options & Equities**

Year	1 Min Peak Total	% Change
2000	7,086	
2001	8,564	21%
2002	18,489	116%
2003	26,647	44%
2004	60,072	125%
2005	118,872	98%
2006	260,269	119%
2007	535,105	106%

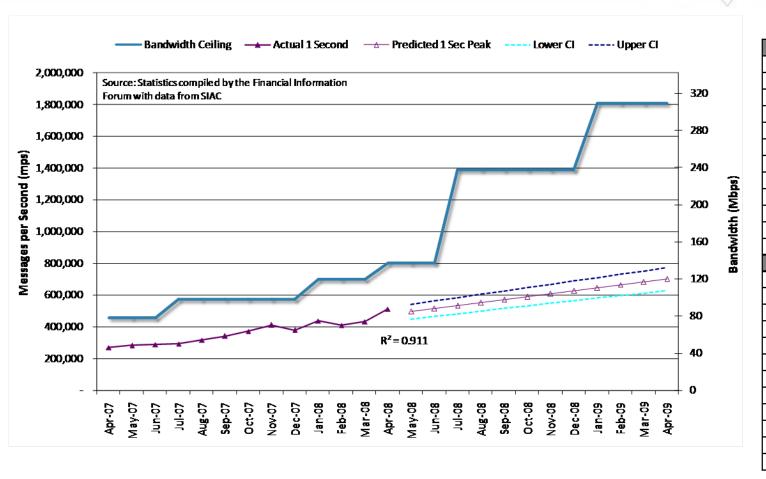

#### **Combined Equities Only**

Year	1 Minute Peaks	% Change
2000	1,252	
2001	1,546	23%
2002	8,398	443%
2003	10,948	30%
2004	21,813	99%
2005	32,533	49%
2006	77,313	138%
2007	229,067	196%

Note: 2007 statistics reflect the addition of new Nasdaq feeds: Nasdaq Level 2, TotalView – ITCH 2.0, and TotalView – ITCH 3.0.

### **Security Processing Growth**

- » DTCC Equity trade side volume has shown significant year to year expansion
  - 32 million average daily trade side volume in 2005
  - 41 million average daily trade side volume in 2006
  - 65 million average daily trade side volume in 2007
  - 88 million YTD average daily trade side volume in 2008 (as of Apr 4)
  - On January 23, 2008, NSCC processed peak volume of 141 million trade sides
- » Capacity initiative implemented in July 2007 increased equities clearance and risk management rated capacity from 160 million trade sides per day to 280 million sides per day
- 2008 corporate goal to reach 450 million side capacity from current280 million rating

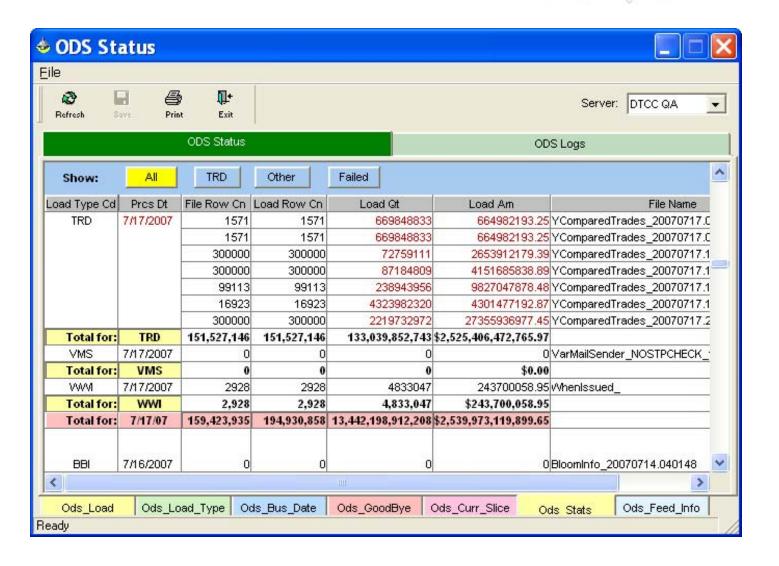

## **NSCC Clearing Sides:**Historical Growth Rate 2000 – 2007

### **Capacity Testing**

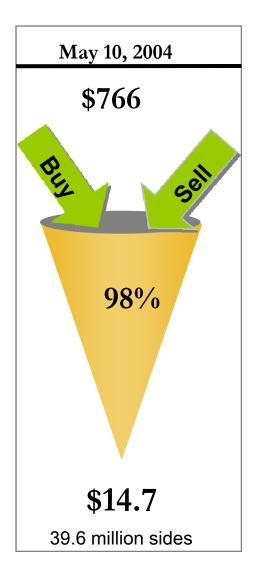

### NSCC:

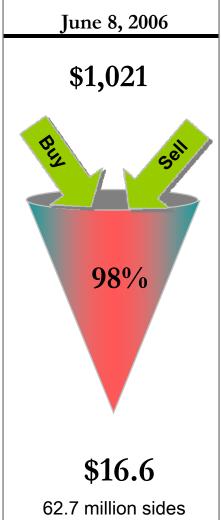

#### Peak Days Netting Factor

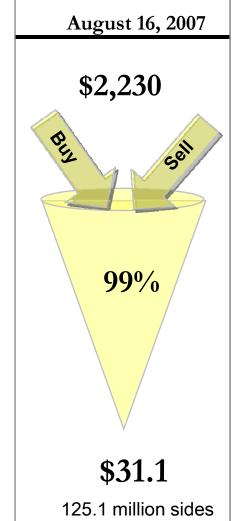

\$ in billions

#### **Understanding Processing Capacity**

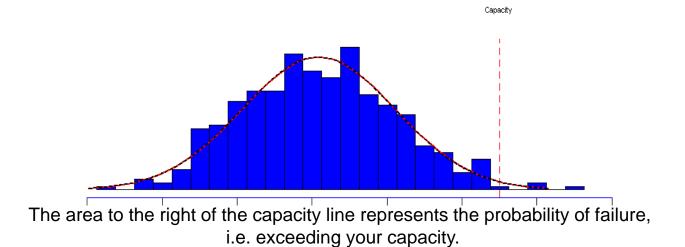

- » How many trades can your system successfully process (throughput) in a given day taking trading patterns and batch time into account?
- » How to determine process capability
  - Understand your process capacity limits
  - Gather volume data
  - Define your risk tolerance (specification limits)
  - Calculate your probability of failure
  - ▶ Track and report your risk

### **Capacity Limits**

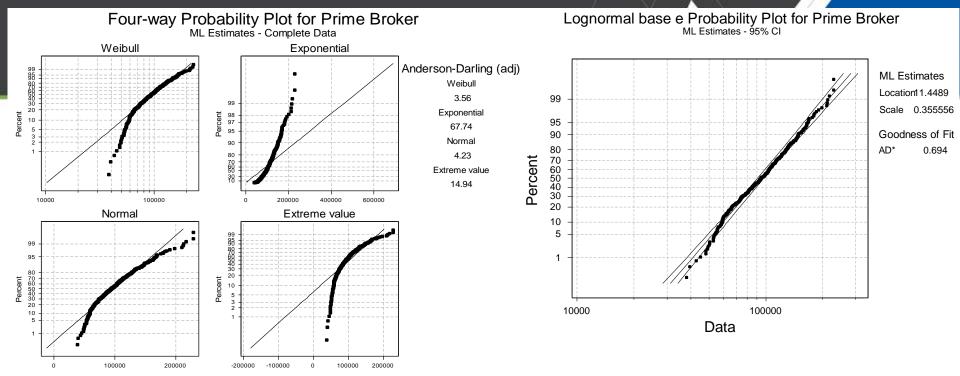

- » Create an E2E process flow
- » Determine capacity of each system in flow
- Capacity of the process is equal to the capacity of the system with the lowest capacity
- Sather daily volume statistics by process flow (desk)

#### Risk Tolerance

- Industry Standard
  - Multiplies of Peak
    - Easy to calculate
    - Time tested
- New Point of View
  - Probability of Failure
    - Statistically Significant
    - Identifies hidden risk
  - ▶ What probability of failure is acceptable at your firm? 1%, .5%, .05%

### Strategies to Address **Capacity Challenges If Justified**

Network Supacity	1 roccssing dapacity
FAST compression ratios around 80%, shrinking	Multi-core CPUs increase processing through
some trade messages from their original 241 bytes	and add flexibility to developers looking to ensi-
to a compressed size of 29 bytes. With less bytes	balanced utilization. For example, configuring
to process, compression and decompression	cores in a dual core CPU to process multicast
latency also improves	group 1 and 2 from OPRA respectively

hput sure both group I and 2 from OPKA respectively

Processing Canacity

minimize disk footprint and overall storage costs easing storage management.

Storage Capacity

**Compress** data stored for regulatory purposes to

Multicast technologies ensure there is only one copy of packet on network branch with subscribers, relieving branches with non-subscribers. Multicast messaging products capable of zero-message loss at rates surpassing million messages per second.

Network Canacity

Specialized processors such as Cell and FPGA. Cell for parallel processing in High Performance Computing for graphics and floating point intense applications. Field Programmable Gate Arrays accelerate overall processing by executing instructions in a specialized coprocessor. For example, FPGA's that receive and process market data can boost throughput by saving CPU cycles required to move messages through protocol stack to operating system.

Outsource regulatory data storage requirements to gain economies of scale. Storage hosting providers provide dynamic storage accommodating peak market volumes. Network data providers provide access to all quotes and trades used by regulators during audits.

**InfiniBand** provides true fabric architecture that leverages switched, point-to-point channels with data transfers up to 120 Gbps. With support for Remote Direct Memory Access (RDMA), throughput maximized and latency minimized.

Code Rewrite of trading and market data applications to utilize concurrency constructs like multi-threading in order to exploit multiple CPU cores. Techniques and tools which promote multithreading to wider programming audience are key.

File Virtualization allows customers to increase storage servers but make them look like a single storage box, simplifying management and increasing the utilization of 'stranded' free space.

Conflation allows data consumers to throttle streaming data rates by suppressing price updates within a specified time interval. Frequently traded instruments producing 1000+ price updates per second can overwhelm subscribers only interested in most recent price on a second-by-second basis.

Application Process Review to identify duplicate operations e.g. retiring applications and streamlining processing e.g. netting transactions for processing and expanding at end of cycle.

Consolidate trading systems storing similar data to minimize storage requirements.

Virtualization reduces number of servers that

Partitioning content across multicast groups (e.g. OPRA's 24) introduces flexibility to downstream subscribers looking to address capacity issues by balancing data volume across network infrastructure.

**Environment** 

**Extranet Providers** offer single high-throughput connection to access broad range of marketplaces.

data vendors and business partners.

**Grids** both data and compute grids offer highlyresilient, dynamically scalable distributed processing infrastructure to distribute load in compute intensive/data intensive environments.

data center physical server requirements. **Multi-core** processors save energy and exhibit higher processing throughout per watt.

have to be powered up. Allows for deployment of widely distributed applications while minimizing

Add Hardware only after addressing with other approaches (e.g. Code Rewrite, Consolidation). Blades with small form factor minimize datacenter space. Cost/benefit analysis of adding hardware needs to be monitored closely.

Power Efficiency with advanced power management tools that enable measuring, analyzing and dynamic provisioning of power.

Server Consolidation of redundant applications and servers to reduce hardware footprint and ease power consumption.

### Summary

- » Market data volume is expanding at astronomical rates
- » Order cancellation rates are high and average trade size is declining
- » Equity trade side volume has shown significant year to year expansion
- » Plan in place to measure and test capacity limits
- » Firms should plan for being able to handle 2.5x peak rates
- » Firms need to explore alternatives to find the best firm-wide fit for expanding capacity
- » Visit Exhibit Hall to discuss alternatives
